

Transition between paediatric and adult diabetes healthcare services: the perceptions of adolescents, young adults, their adult carers and healthcare professionals

(University of the Sunshine Coast, Australia, HREC Approval Number A231935)

Our research team would like to determine the perceptions of adolescents, young adults, their adult carers, and healthcare professionals around the transition from paediatric to adult diabetes healthcare services. We intend to use study findings to help formulate international consensus guidelines on transition between paediatric and adult-based diabetes healthcare services (by the International Society for Pediatric and Adolescent Diabetes, the American Diabetes Association, and the European Association for the Study of Diabetes). As a healthcare professional providing care to patients with diabetes, we invite you to:

- 1.) Participate in an online survey yourself, which will take around 15 minutes to complete. Please click on the applicable link or scan the QR code for further information
- 2.) Invite persons with diabetes (and/or their adult carer) receiving related care at your setting, of age 14-25 (inclusive) and who are able to converse in English, French, Portuguese, Spanish, Swahili, Mandarin, or Polish languages to participate in an online survey, which will take around 15 minutes to complete. Please click on the applicable link or scan the QR code for further information. If you are providing information around the time of consultation, can you please mention the study at the end of this.
